Sequence 115, Application US/09874601

Patent No. 6632057

GENERAL INFORMATION:
APPLICANT: LEWIN, ALFRED S.
APPLICANT: SHAW, LYNN C.
APPLICANT: GRAWT, MARIA B.
TITLE OF INVENTION: THE TREATMENT OF RETINAL DISEASES
FILE REFERENCE: 4300.014100
CURRENT APPLICATION NUMBER: US/09/874,601

Batent No. 5877021

GENERAL INFORMATION:
APPLICANT: Stinchcomb, Daniel T.
APPLICANT: Jarvis, Thale

APPLICANT: Marvis, Thale
TITLE OF INVENTION: METHOD AND REAGENT FOR THE
TITLE OF INVENTION: INDUCTION OF GRAFT TOLERANCE
TITLE OF INVENTION: AND REVERSAL OF IMMUNE RESPONSES
NUMBER OF SEQUENCES: 2751
CORRESPONDENCE ADDRESS:
                                                                                                             GENERAL INFORMATION:
APPLICANT: Draper, Kenneth G.

Sequence 60, Application US/09580794C

Patent No. 6331389

GENERAL INPORMATION:
APPLICANT: Louwagie, Joost

APPLICANT: Louwagie, Joost

TITLE OF INVENTION: METHOD FOR DETECTION OF DRUG-INDUCED MUTATIONS IN THE REVERSE

TITLE OF INVENTION: METHOD FOR DETECTION OF DRUG-INDUCED MUTATIONS IN THE REVERSE

TITLE OF INVENTION: TRANSCRIPTASE GENE

FILE REFERENCE: INSOODS-2

CURRENT FILING DATE: 1997-09-15

PRIOR FILING DATE: 1997-09-15

PRIOR FILING DATE: 1997-00-17

PRIOR FILING DATE: 1996-01-26

NUMBER OF SEQ ID NOS: 164

Sequence 397, Application US/09081646

Patent No. 6333152

GENERAL INFORMATION:

APPLICANT: Kinzler, Kenneth

APPLICANT: Chang, Lin

APPLICANT: Zhang, Lin

TITLE OF INVENTION: Gene Expression Profiles in No. 6333152mal and

TITLE OF INVENTION: Cancer Cells

TITLE OF INVENTION: Cancer Cells

TITLE OF INVENTION: Cancer Cells

CURRENT APPLICATION UNMERR: US/09/081,646

CURRENT FILING DATE: 1998-05-20

                                                                                                                                                                           The present invention relates to novel antisense oligonucleotides which are targeted to human acyl CoA cholesterol acyltransferase-2 (ACAT-2) mucleotide sequence (ACC42409-ACC42411), and mouse ACAT-2 (ACC42412-ACC42457). The antisense oligonucleotides specifically hybridise with and inhibit the expression of ACAT-2 nucleotide sequences (ACC42355 and ACC42402). ACAT enzymes catalyse the synthesis of cholesterol esters from free cholesterol and fatty acyl-CoA. The antisense oligonucleotides are useful for treating an animal which has a disease or condition associated with ACAT-2, e.g. a condition involving abnormal lipid metabolism, atherosclerosis, or

The enzyme acyl Coenzyme A-cholesterol acyltransferase 1 (ACAT1) mediates sterol esterification, an important component of intracellular lipid homeostasis. The present invention relates to human ACAT Related Gene Product 2 (ARGP2). ARGP2 is a diacylglycerol acyltransferase (DGAT). ARGP2 is a tissue specific sterol esterification enzyme. The present sequence is a PCR primer used to isolate ARGP2 coding sequence (see
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Coenzyme A-cholesterol acyltransferase 1; ACAT1;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New nucleic acid encoding a human diacylglycerol acyltransferase, useful for treating hyperlipidemia, atherosclerosis, heart disease, or other diseases associated with an imbalance of triglyceride levels.
                                                                                                                                                                        Gaps
homeostasis. The present invention relates to human ACAT Related Gene
Product 2 (ARGP2). ARGP2 is a diacylglycerol acyltransferase (DGAT).
ARGP2 is a tissue specific sterol esterification enzyme. The present
sequence is a PCR primer used to isolate ARGP2 coding sequence (see
                                                                                                                                                                          ..

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention provides polymorphic fragments of genes associated with hypertension. The nucleic acids including the polymorphic sites can be used as probes or primers for expressing variant proteins. Detection of the polymorphisms is useful in designing prophylactic and therapeutic regimes customized to underlying abnormalities. The polymorphisms can be used for association studies for hypertension, and in hypertension diagnostic assays. Where the polymorphisms have strong correlation with hypertension, within a gene, they are likely to have a causative role in hypertension. This information can be used to find the precise role of a polymorphism in the disease, and this can be used to identify potential drugs which combat the disease. The polymorphisms can be tested for association with other disease e.g. agammaglobulinemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular dystrophy, Miskott-Adrich

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes enzymatic nucleic acid molecules (NAMs) which specifically cleave RNA derived from an epidermal growth factor receptor (EGF-N) gene. AAV9721 to AAV98043 and AAV98929 to AAV990090 represent specifically claimed target sequence from human EGF-R. AAV98044 to AAV98866 and AAV98867 to V9878 represent hammerhead ribozymes and hairpin ribozymes respectively for human EGF-R. The NAMs are useful for cleaving EGF-R RNA in the treatment of a condition associated with EGFR expression levels e.g. to inhibit cell proliferation in the prevention or treatment of cancers. The NAMs can also be used as diagnostic tools to examine genetic drift and mutations within diseased cells or to detect the presence of EGF-R RNA in a cell

```
The present invention relates to novel antisense oligonucleotides which are targeted to human acyl CoA cholesterol acyltransferase-2 (ACAT-2) nucleotide sequence (ACC42409-ACC4431). And mouse ACAT-2 (ACC42432-ACC42457). The antisense oligonucleotides specifically hybridise with and inhibit the expression of ACAT-2 nucleotide sequences (ACC42395 and ACC424205). ACAT enzymes catalyse the synthesis of cholesterol esters from free cholesterol and fatty acyl-CoA. The antisense oligonucleotides are useful for treating an animal which has a disease or condition associated with ACAT-2, e.g. a condition involving abnormal liptid metabolism, a condition involving abnormal cholesterol metabolism, a therosclerosis, or cardiovascular disease. The present sequence is a PCR primer for human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New antisense oligonucleotides for modulating acyl CoA cholesterol acyltransferase.2, e.g. for preventing or treating diseases associated with abnormal lipid or cholesterol metabolism, atherosclerosis, cardiovascular disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

                                                                                                                                                               The present sequence represents a PCR primer for the human acyl
COA:cholesterol acyltransferase designated ACAT-2. ACAT-2 polypeptides
Coan be administered therapeutically, especially by expressable encoding
polymucleotides, to treat individuals in need of ACAT-2 polypeptide. They
may especially be administered to treat disease conditions associated
with elevated cholesterol ester levels e.g. hypercholesterolaemia or
hyperlipidaemia (including hypertriglyceridaemia), since ACAT-2 catalyses
the esterification of cholesterol with fatty acyl COA substrates. The
polypeptides can also be used to diagnose diseases related to polypeptide
coppositions activity, by analysing for polypeptide presence or amount
in a sample. They are useful to screen for compounds inhibiting or
activating the polypeptide, which can be included in pharmaceutical
compositions and administered therapeutically to treat conditions
associated with ACAT-2; inhibitory agents can especially be used to
inhibit ACAT-2 activity, especially therapeutically, and especially
agents which selectively inhibit ACAT-2 and not prior art ACAT-1
                                                                                                                                                                                                                                                                                                                                                                                                                           ö

The present sequence represents a PCR primer for the human acyl

CoA:cholesterol acyltransferase designated ACAT-2. ACAT-2 polypeptides

Coan be administered therapeutically, especially by expressable encoding

polynucleotides, to treat individuals in need:of ACAT-2 polypeptide. They

may especially be administered to treat disease conditions associated

with elevated cholesterol ester levels e.g. hyperchlesterolaemia or

hyperlipidaemia (including hypertriglyceridaemia), since ACAT-2 catalyses

the esterification of cholesterol with fatty acyl CoA substrates. The

polypeptides can also be used to diagnose diseases related to polypeptide

coppositions and administered therapeutically to treat conditions

activating the polypeptide, which can be included in pharmaceutical

compositions and administered therapeutically to treat conditions

associated with ACAT-2, inhibitory agents can especially be used to

inhibit ACAT-2 activity, especially therapeutically, and especially

agents which selectively inhibit ACAT-2 and not prior art ACAT-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

                                                                                                                  are targeted to human acyl COA cholesterol acyltransferase-2 (ACAT-2) nucleotide sequence (ACC42409-ACC42411), and mouse ACAT-2 (ACC42432-ACC42402). The artisense oligonucleotides specifically hybridise with and inhibit the expression of ACAT-2 nucleotide sequences (ACC4235 and ACC42402). ACAT enzymes catalyse the synthesis of cholesterol esters from free cholesterol and fatty acyl-COA. The antisense oligonucleotides are useful for treating an animal which has a disease or condition associated with ACAT-2, e.g. a condition involving abnormal lipid metabolism, a condition involving abnormal lipid metabolism, a condition and cholesterol metabolism, atherosclerosis, or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /mod_base= OTHER
/note= "Oligonucleotide has phosphorothioate backbone and
all cytidine nucleotides are 5-methylcytidine. Optionally
some nucleotides with 2'-methoxyethyl (2'-MOE wings)
                                                                                                         The present invention relates to novel antisense oligonucleotides which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Acyl CoA cholesterol acyltransferase-2; antisense therapy; antilipemic; antiarteriosclerotic; cardiovascular; ACAT-2; lipid metabolism; cholesterol metabolism; atherosclerosis; cardiovascular disease; phosphorochioate; human; ss.
acyltransferase-2, e.g. for preventing or treating diseases associated with abnormal lipid or cholesterol metabolism, atherosclerosis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      acyltransferase-2, e.g. for preventing or treating diseases associated with abnormal lipid or cholesterol metabolism, atherosclerosis, cardiovascular disease.

                                                              are targeted to human acyl CoA cholesterol acyltransferase-2 (ACAT-2) nucleotide sequence (ACG42409-ACC42431), and mouse ACAT-2 (ACC42432-ACC42457). The antisense oligonucleotides specifically hybridise with and inhibit the expression of ACAT-2 nucleotide sequences (ACC42355 and ACC42402). ACAT enzymes catalyse the synthesis of cholesterol esters from free cholesterol and fatty acyl-CoA. The antisense oligonucleotides are useful for treating an animal which has a disease or condition associated with ACAT-2, e.g. a condition involving abnormal lipid metabolism, a condition involving abnormal lipid metabolism, a therosclerosis, or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         /note= "Oligonucleotide has phosphorothioate backbone and all cytidine nucleotides are 5-methylcytidine. Optionally some nucleotides with 2'-methoxyethyl (2'-MOE wings)
                                               present invention relates to novel antisense oligonucleotides which

The present invention relates to novel antisense oligonucleotides which are targeted to human acyl CoA cholesterol acyltransferase-2 (ACAT-2) nucleotide sequence (ACC44409-ACC42431), and mouse ACAT-2 (ACC42437). The antisense oligonucleotides specifically hybridise with and inhibit the expression of ACAT-2 nucleotide sequences (ACC42385 and ACC4402). ACAT enzymes catalyse the synthesis of cholesterol esters from tree cholesterol and fatty acyl-CoA. The antisense oligonucleotides are with ACAT-2, e.g. a condition associated with ACAT-2, e.g. a condition involving abnormal lipid metabolism, a therosclerosis, or

  ACC42457). The antisense oligonucleotides specifically hybridise with and inhibit the expression of ACAT-2 nucleotide sequences (ACC42198 and ACC42402). ACAT enzymes catalyse the synthesis of cholesterol esters from free cholesterol and fatty acyl.CoA. The antisense oligonucleotides are useful for treating an animal which has a disease or condition associated with ACAT-2, e.g. a condition involving abnormal lipid metabolism, a condition involving abnormal incleases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          /not== "Oligonucleotide has phosphorothioate backbone and all cytidine nucleotides are 5-methylcytidine. cholesterol and fatty acyl-CoA. The antisense oligonucleotides are

. 0 useful for treating an animal which has a disease or condition associated with ACAT-2, e.g. a condition involving abnormal lipid metabolism, a condition involving abnormal cholesterol metabolism, atherosclerosis, or are targeted to human acyl CoA cholesterol acyltransferase-2 (ACAT-2) mucleotide sequence (ACG42409-ACG42431), and mouse ACAT-2 (ACG42432-ACG42457). The antisense oligonelocides specifically hybridise with and inhibit the expression of ACGT-2 nucleotide sequences (ACG42395 and ACG42402). ACAT enzymes catalyse the synthesis of cholesterol esters from tree cholesterol and fatty acyl-CoA. The antisense oligonucleotides are useful for treating an animal which has a disease or condition associated with ACAT-2, e.g. a condition involving abnormal lipid metabolism, a /mod\_base= OTHER //note= "Oligonucleotide has phosphorothioate backbone and all cytidine nucleotides are 5-methylcytidine. Optionally some nucleotides with 2'-methoxyethyl (2'-MOE wings) Acyl CoA cholesterol acyltransferase-2; antisense therapy; antilipemic; antiarteriosclerotic; cardiovascular; ACAT-2; lipid metabolism; cholesterol metabolism; atherosclerosis; cardiovascular disease; phosphorothioate; human; ss. The present invention relates to novel antisense oligonucleotides which acyltransferase-2, e.g. for preventing or treating diseases associated with abnormal lipid or cholesterol metabolism, atherosclerosis, Gaps Acyl CoA cholesterol acyltransferase-2 antisense oligo ISIS #140155 New antisense oligonucleotides for modulating acyl CoA cholesterol ; 0 Match 1.3%; Score 20; DB 1; Length 20; Local Similarity 100.0%; Pred. The antisense oligonucleotides specifically hybridise with and inhibit the expression of ACAT-2 nucleotide sequences (ACC42395 and ACG42402). ACAT enzymes catalyse the synthesis of cholesterol esters from tree cholesterol and fatty acyl-CoA. The antisense oligonucleotides are useful for treating an animal which has a disease or condition associated with ACAT-2, e.g. a condition involving abnormal lipid metabolism, a condition involving abnormal lipid metabolism, archerosclerosis, or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to novel antisense oligonucleotides which are targeted to human acyl CoA cholesterol acyltransferase-2 (ACAT-2) nucleotide sequence (ACC42409-ACC42411), and mouse ACAT-2 (ACC42432-ACC42457). The antisense oligonucleotides specifically hybridise with and inhibit the expression of ACAT-2 nucleotide sequences (ACC42395 and ACC42402). ACAT enzymes catalyse the synthesis of cholesterol esters from tree cholesterol and fatty acyl-CoA. The antisense oligonucleotides are useful for treating an animal which has a disease or condition associated with ACAT-2, e.g. a condition involving abnormal lipid metabolism, a condition involving abnormal cholesterol metabolism, atherosclerosis, or
                                                                                                                                                                                                                                                                                                                                                                   /note= "Oligonucleotide has phosphorothioate backbone and all cytidine nucleotides are 5-methylcytidine. Optionally some nucleotides with 2'-methoxyethyl (2'-MOE wings)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to novel antisense oligonucleotides which are targeted to human acyl CoA cholesterol acyltransferase-2 (ACC47-2) mucleotide sequence (ACC42409-ACC42411), and mucuse ACAT-2 (ACC42403-ACC42457). The antisense oligonucleotides specifically hybridise with and inhibit the expression of ACAT-2 nucleotide sequences (ACC42195 and ACC42402). ACAT enzymes catalyse the synthesis of cholesterol esters from free cholesterol and fatty acyl-CoA. The antisense oligonucleotides are useful for treating an animal which has a disease or condition associated with ACAT-2, e.g. a condition involving abnormal lipid metabolism, a condition involving abnormal theresclerosis, or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /mod_base= OTHER // note= "Oligonucleotide has phosphorothicate backbone and all cytidine nucleotides are 5-methylcytidine. Optionally some nucleotides with 2'-methoxyethyl (2'-MOE wings)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Acyl CoA cholesterol acyltransferase-2; antisense therapy; antilipemic; antiatreficosferotic; cardiovascular; ACAT-2; lipid metabolism; cholesterol metabolism; atherosclerosis; cardiovascular disease; phosphorothioate; human; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New antisense oligonucleotides for modulating acyl CoA cholesterol acyltransferase-2, e.g. for preventing or treating diseases associated with abnormal lipid or cholesterol metabolism, atherosclerosis,
